SENDRA

Know Your Customer Policy

19 October 2026

1. Purpose

This policy describes how Sendra identifies a customer before that customer moves naira. It covers buy, sell, cash-out to a bank, and a payment whose crypto is delivered to an address the customer supplies, including a Polymarket deposit address.

The customer uses WhatsApp. The check itself is completed on a secure page in the browser. Sendra tells the customer on WhatsApp when a tier is approved.

2. When a tier is required

The limit is the naira value of one transaction. The customer must already hold the tier for that amount, or complete it before the payment is opened.

- Below 50,000 naira: Tier 0. No formal identity check.
- 50,000 to 200,000 naira: Tier 1.
- 201,000 to 2,000,000 naira: Tier 2.
- 2,000,001 to 50,000,000 naira: Tier 3.

If the amount is above the customer's tier, WhatsApp stops the payment. The customer can start verification or change the amount. The verification link expires after 45 minutes. After approval, the customer can continue the payment they started.

These tiers cap naira payments. They do not cap USDC or USDT deposits and withdrawals, and they do not cap the balance held in the wallet.

3. Tier 0

A transaction below 50,000 naira needs the WhatsApp phone number and the destination. The destination is the bank account being paid, or the wallet that will receive the crypto. Sendra does not ask for a legal name, a NIN, a BVN, or an address at this tier.

4. Tier 1

Tier 1 is required from 50,000 naira. It has two parts, in this order.

Source of wealth

Before the NIN, the customer chooses one source of wealth:

- Salary or employment
- Business income
- Savings

- Investment
- Gift or family support
- Pension
- Other

The customer uploads one proof of that source: a receipt, invoice, payslip, or statement. The file must be a PDF, JPG, or PNG, and it must be under 5 MB. Sendra reads the file type from the file itself. A renamed file of another type is rejected. The customer cannot continue without both a choice and a file.

NIN and legal name

The customer then enters their full legal name and their 11-digit NIN. Sendra checks the NIN with the identity provider. The name the customer typed must match the name on the NIN. The order of the names does not matter, but every name on the NIN must be included. The phone number on the NIN must match the WhatsApp number on the Sendra account.

Tier 1 is saved only after the NIN check passes. Sendra stores the source of wealth the customer chose, the proof file, the verified name, the phone number on the NIN, and the last four digits of the NIN. The full NIN is not stored. The proof file is kept outside the website under a random name. It is not available on a public link. If the account cannot be updated, the file is deleted and Tier 1 is not marked complete.

5. Tier 2

Tier 2 is required from 201,000 naira. The customer must already have Tier 1.

The customer enters their 11-digit BVN and takes a live photograph with the front camera on their device. A photo from the gallery is not accepted. Sendra checks the BVN with the identity provider. The phone number on the BVN must match the WhatsApp number on the account. The photograph must match the face on the identity record.

Sendra stores the verified name on the BVN, the phone number on the BVN, the last four digits of the BVN, and that the liveness check passed. The full BVN is not stored.

6. Tier 3

Tier 3 is required from 2,000,001 naira, up to 50,000,000 naira per transaction. The customer must already have Tier 2.

The customer enters a residential address: house number, street, local government area, and state. They choose a proof of address, either a utility bill or a bank statement, and upload it. The file must be a PDF, JPG, or PNG, and it must be under 5 MB.

The address is submitted for verification. Sendra stores the address encrypted. The

stored record includes the house number, street, local government area, state, the full address line, and the type of proof. An administrator can read those fields from the customer record. The full NIN and the full BVN are still not stored.

7. What staff can see

On the Customers page, View KYC shows each tier the customer has completed.

- Tier 1 shows the source of wealth, the name on the NIN, the phone number on the NIN, and the NIN as the last four digits. The proof document opens only for a signed-in administrator.
- Tier 2 shows the name on the BVN, the phone number on the BVN, the BVN as the last four digits, and whether the liveness check passed.
- Tier 3 shows the address and the type of proof.

A customer who has not completed Tier 1 does not have this record. Tier 0 is not a completed identity check.

8. What is never stored

- The full NIN.
- The full BVN.
- A public link to a source-of-wealth document or a proof of address.

A failed check does not raise the tier. The customer sees the reason on the verification page and can try again. A verification link that is older than 45 minutes cannot be used. The customer returns to WhatsApp and starts verification again.

9. Review

Source-of-wealth documents and proof-of-address documents are for staff review. The system checks that a file of an allowed type was uploaded, and it checks the NIN, the BVN, the phone match, and the liveness photograph with the identity provider. Staff open the uploaded document from the admin dashboard when they need to read it.

This policy matches the checks in the live Sendra wallet as at 19 October 2026.
