SENDRA

Enterprise risk framework

Transaction monitoring, scoring, and reporting
20 October 2026

1. Purpose

This framework scores Sendra wallet activity from 0 to 10, flags transactions that need review, pauses a customer when a set pattern is met, and tells staff when a transaction must be filed. Sendra does not keep a separate compliance department. The transaction monitor reports to staff. Staff report to management. Management decides the report.

The score belongs to the customer's phone number. A crypto wallet address is not scored or blocked on its own. The number on a row is the highest score from the size of that transaction and the behaviour of that phone. The row keeps every reason that applied.

2. How a score is produced

A scan runs every 5 minutes, and again when the Monitoring page is opened. It reads pending and confirmed activity from the last 14 days. A row is saved when the score is 3 or higher, or when the transaction must be filed on the SCUML dashboard.

- Score 3 is saved and shown under All scored. It is not emailed.
- Score 6 or higher is emailed once, to the addresses set in the admin Settings. Scores 6 to 8 are escalated to management.
- Score 9 or 10 is escalated to management, and the pattern is marked for a report to the NFIU.

The dollar value of a transaction is the larger of the crypto amount and the naira amount converted to dollars. USDC, USDT, and USD count one for one. Naira uses the rate already on that transaction. If the transaction has no rate, the fallback is 1,600 naira per dollar.

3. Size of one transaction

- 100 dollars or more, and under 1,000 dollars: score 3.
- 1,000 dollars or more, and under 5,000 dollars: score 6.
- 5,000 dollars or more, up to 10,000 dollars: score 8.
- Above 10,000 dollars: score 10.

A large single transaction is flagged. It does not, by itself, pause the customer.

4. Just under 50,000 naira

This counts off-ramps whose naira payout is from 40,000 naira up to, but not including,

50,000 naira. Pending and confirmed off-ramps both count. The window is the last 1 day. The rule starts only when there are more than 5.

- 6 or 7 in 1 day: score 6 or 7.
- 8 or 9 in 1 day: score 8.
- 10 or 11 in 1 day: score 9.
- 12 or more in 1 day: score 10.

Transfers are paused for 1 day, then resume on their own.

5. Many destinations in 1 day

One phone pays 10 or more different bank accounts or wallets in the last day. The score is 8. Transfers are paused for 1 day, then resume on their own.

A bank destination is the account number on a cash-out. A wallet destination is the address on a send, or an outgoing on-chain transfer to someone else's address. The customer's own wallet is not counted as a destination.

6. Many phones, one destination

Ten or more different phone numbers pay the same bank account or the same wallet in the last day. Each of those phones scores 8. Transfers are paused for 1 day, then resume on their own.

7. Repeat payout to the same bank

One phone pays the same bank account 3 or more times inside any 5-minute window. The score is 6. Transfers are paused for 30 minutes, then resume on their own.

8. KYC gaps, over 30 days

This uses off-ramps of 40,000 to 49,999 naira across 30 days. It does not pause the account.

- KYC was started and left open, and there is at least 1 of those off-ramps: score 6. If there are 6 or more, the score is 8.
- There is no completed Tier 1, and there are 3 or more of those off-ramps: 3 to 5 scores 6, 6 or 7 scores 8, and 8 or more scores 9.

Tier 1 counts as completed when the tier is at least 1, KYC is marked verified, or a NIN last-four is on file. One ordinary transfer under 50,000 naira, with no KYC, is not flagged by itself. The identity checks, including source of wealth, are set out in the Sendra Know Your Customer Policy.

9. SCUML filing

SCUML filing is separate from the behaviour scores. It forces the score to 10. A

transaction is reportable when either of these is true.

- The dollar value is above 10,000 USD or 10,000 USDC.
- The naira value is above 5,000,000 naira for an individual, or above 10,000,000 naira for a business.

A customer is a business only when the account type is business, corporate, or company. WhatsApp customers are individuals. The row says to file it on the SCUML dashboard. It stays under Not filed until someone marks it filed. A value of exactly 10,000 dollars is not a SCUML filing. It scores 8 from the size table. A SCUML-sized transaction is flagged. It does not, by itself, pause the customer.

10. What a pause does

During a pause the customer cannot buy, sell, send, swap, or confirm a PIN. WhatsApp tells them the time transfers resume. When that time passes, the account works again. No admin action is required to reopen it.

The same burst does not start a second pause after the first one ends. A new burst does. The Monitoring page lists every account that is paused, with the reason and the time it resumes.

A pause starts only for the four patterns in sections 4 to 7. A score of 6 from the size of one transaction, a SCUML filing, or a KYC-gap score does not pause the customer.

11. Reporting workflow

The transaction monitor flags the activity and emails staff. Staff report it to management. Management decides whether to report it to the EFCC or to the NFIU. The timeline for that decision is 1 day.

Scores of 6 to 8 are for management review. Scores of 9 and 10 are for management review and a report of the suspicious pattern to the NFIU. A transaction above the SCUML thresholds in section 9 is filed on the SCUML dashboard. Marking it filed in the admin dashboard records the date. It does not send the filing by itself.

12. What the Monitoring page shows

- Score 6 or higher: every saved row at 6 or above, including SCUML rows.
- SCUML reportable: transactions that must be filed on the SCUML dashboard.
- Not filed on SCUML: those transactions before they are marked as filed.
- All scored: every saved row, including score 3.

Opening a row shows the reasons, and the off-ramp, on-ramp, or on-chain details: account name, account number, bank, amounts, conversion rate, source, destination, network, and transaction hash. For a naira-to-crypto purchase, the bank payment and the wallet credit are tied by the order id, the customer's phone number, and the

destination wallet.

13. Private wallets

A wallet is private and unhosted when Sendra does not hold the keys. That includes an address the customer supplies, such as a Polymarket deposit address, and a temporary 1Click address used to deliver funds to a wallet Sendra does not control. Sendra does not custody those wallets and cannot reverse a payment after it is sent. The destination is still stored on the transaction and can be reviewed under this framework.

A 1Click hop that Sendra uses to convert funds it already controls, for example from Aptos to Stellar so a Sendra settlement can finish, is not treated as a customer's private wallet. Those funds start and end in a wallet Sendra controls.

This framework matches the checks in the live Sendra transaction monitor as at 20 October 2026.
